# Technologies

Bridgestone's proprietary tire development technology for measuring and visualizing tire contact surface behavior during actual riding conditions. Previously, tire development consisted of running simulations, building prototypes and using laboratory measurements as well as actual vehicle tests to verify performance. ULTIMAT EYETM reproduces high-speed riding conditions in the laboratory that are equivalent to those of an actual vehicle, enabling tire contact surface behavior to be visualized. In addition to the previous actual vehicle tests, this allows high-precision analysis and performance verification with a solid scientific basis. Using technology born to develop tires for the world's most demanding car and motorcycle races, the measurement and analysis equipment can handle speeds of up to 400km/h and lean angles of up to 60 degrees.

**HTSPC High Tensile Super Penetrated Cord:**  
Steel cord material is comprised of individually rubber insulated inner filaments with high thermal conductivity to enhance heat transfer and reduce the risk of blowout. Moisture does not accumulate between filaments, reducing the chance of oxidation. The features promote high speed stability and durability of the tire as a whole. High case rigidity (grip performance) and superior shock absorption have also been achieved by these highly tensile filaments which have strong resistance to deformation.

**MS - BELT Mono Spiral Belt (Patent acquired):**  
Lightweight and durable cords are wrapped around the circumference of the tire to provide a smooth grip feeling. This contributes to a high performance tire with weight reduction, improvement in grip improvement, rotational stability, high speed performance and excellent damping effect.

**V-MS-BELT**  
The variable mono spiral belt design optimises the distance between the HTSPC cords to more efficiently distribute the stiffness across the entire width of the tyre.

**GP-BELT:**  
A new belt added to the conventional MS BELT. The pressure has been equalized to the ground surface. By enlarging the ground contact surface area, gripping performance during cornering has been improved. This also contributes to better gripping, reduction in ground contact surface area which causes slipping, and better wear control.

**CAP & BASE:**  
The underlying Cap & Base layer enhances tread stiffness for better grip, shock absorption and all-weather performance.

**5LC 5 Layer Compound (Patent acquired):**  
5LC (5 Layer Compound) technology. High grip performance has been achieved for every sports racing scene. The edge compound improves rotational stability during steep banking. The shoulder compound improves cornering power and grip performance in the forward direction. The center compound achieves a smooth feeling from straight runs to lean angles.

**CASTLE BLOCK TECHNOLOGY:**  
The Castle Block convex pattern provides better grip on loose surfaces while maintaining stability during acceleration and cornering.

## 3LC3 Layer Compound:

3LC (3 Layer Compound) technology. The shoulder compound provides excellent cornering grip. The center compound offers linear handling.

## SILICA RICH EX:

Performance in wet conditions is improved by greatly increasing the amount of silica compared to conventional SILICA RICH.

## RC POLYMER and NanoPro-Tech® for motorcycle:

Polymer improves wear resistance of tires, and silica is effective for wet performance. Although these two compounds are usually not compatible, the potential of both compounds is drastically increased by promoting affinity between them. RC POLYMER for motorcycles, developed using Bridgestone's key technology NanoPro-Tech®, contributes to the improvement of wet performance and longer wear life. Bridgestone's advanced NanoPro-Tech™ technology optimizes the performance characteristics of the tyre by controlling the interaction between polymer, filler materials and other rubber chemicals on a molecular level. This helps reduce friction, heat and tread deformation during tyre rotation, leading to better tread grip and longer wear life through molecular design, in order to emphasize the needed characteristics of the material.

## SACT Straight And Cornering Technology:

The center area utilizes a compound which specializes in wear resistance, and the shoulder with a compound which specializes in grip performance. By combining these compounds, two conflicting features, "long life durability" and "high grip performance" have been dimensionally fused. The two compounds are unified through intermolecular coupling at high temperature.

## Asymmetric Pattern

The asymmetric pattern on the front tyre keeps grip during cornering and under heavy braking.

## COOLING FIN:

Cooling fins makes the tyre up to 10c° colder and gives a stiffer tyre sidewall.

# PRODUCT RANGE

## Security meets performance

### **BATTLAX SPORT TOURING T31**

3LC compound with Cap and base structure on the Rear tyre : Balance between Grip and cornering stability

New front compound with new molecular approach : Improved silica dispersion

Flexibility of the rubber increased for better contact feel of the surface

Contact patch increase (up to 7%) from 0° to full lean angle : Generating higher camber trust (force to make the bike turn)

Ultimate EYE Data shows the bigger adhesion area and smaller slippage area :

Wet cornering grip improved Improved dry handling response

- 3% Higher Friction Coefficient on wet surface
- 3% Faster Lap time on Wet handling track
- Contact feel and feedback for maximum confidence

# SPORT TOURING BATTLAX

T = TOURING

New Battlax Sport Touring T31, “where security and performance meet”. The T31 is Bridgestone’s new flagship when it comes to a combination of safety and performance. The safe feeling of T31 comes from the feeling and feedback that the tyre gives.

With increased “land and sea” conditions, the T31 provides improved water drainage and larger pattern blocks to maintain rigidity while increasing footprint in all tyre closure angles.

3% higher friction conditioner on wet surfaces

3% faster lap time on wet track

Increased contact feeling for feedback and maximum confidence

## BATTLECRUISE H50 DIAGONAL

# BATTLECRUISE H50

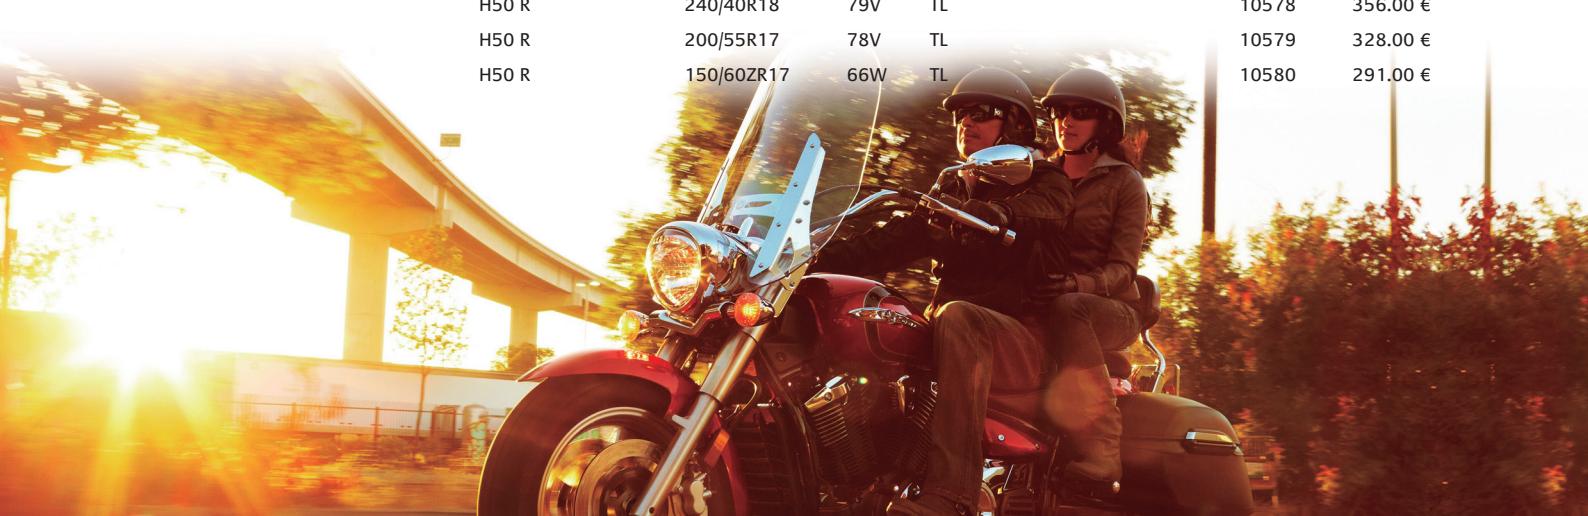

There is finally a Bridgestone tyre for Harley Davidson, Indian and Victory. Unlike the original tyre, the Battlecruise H50 offers stability and wet grip beyond the usual. Add in 30% longer service life too. Be sure to shoe up your American beauty with a pair of quality tyres. There are also model-adapted tubes with off-center valves.

Additional dimensions in 2018, in radial construction to cover 80% of the Harley Davidson range.

# **BRIDGESTONE**

## **BATTLAX ADVENTURE A41**

- Wet grip and contact feel improved (8% faster lap time on test track against A40)
- Improved performance in all areas
- Retained wear life
- Now OE on the BMW R1200GS and Honda Africa Twin, 2018 models
- Full line up

## OFF ROAD RADIAL

**BATTLAX ADVENTURE A41**

A41

Battlax Adventure A41 comes in 16 dimensions and replaces Battle Wing B501 / B502 and Battlax Adventure A40.

Increased contact feeling, wet grip and comfort are some of the characteristics of the A41 without sacrificing anything in durability. Even the footprints on shoulders have become larger for maximum grip. MS Belt, HTSPC 3LC, Cap & Base, Nano Protech and Silica Rich EX provide better compliance.

- Wet grip and contact feeling (8% faster lap time on test track against A40)
- Improved performance in all areas
- No compromise on durability
- Dual compound front and rear
- Full line up

## Generation M

M203/M204

Bridgestone motocross tyres M203 / 204 and M403 / 404 are intended for soft and intermediate courses. Cap & Base and SACT technology (dual compound in both the body and tread and shoulders) guarantee stability and grip in abundance, perfect for everything from play to serious racing in both MX / ENDURO.

The ED663 / ED668 is developed specifically for tough enduro conditions, providing grip and control on everything from muddy to hard surfaces. FIM Approved.

## BATTLAX SPORT TOURING T31

*'RiDE says These new-for-2018 tyres feel really sporty but also have impressive levels of wet grip, comfort and stability. They generate good feel straight away, as scrub-in was quick and they were up to temperature in just two laps. They enhanced how the bike felt, giving a more refined ride over the OE tyres. In terms of steering, there's good linear feel at the handlebars, meaning that it's accurate with minimal rider effort. Excellent feedback and precision in all areas of the track especially where there were big puddles - the tyre just dispersed the water without fuss. Excellent grip and superior feel that translates into rider confidence. These tyres are capable of fast and safe wet riding.'* RiDE Magazine, April 2018.
